--- layout: brief title: "Brief: Coder - Staff Software Engineer, Agentic Engineering (Postingâ€¦" description: "Tailored 1-page executive pitch brief for Staff Software Engineer, Agentic Engineering (Posting #6596) at Coder." permalink: /exports/briefs/coder-staff-agentic-engineering/ breadcrumb: "Coder Brief" breadcrumb_parent_name: Exports breadcrumb_parent_url: /exports/ brief_company: "Coder" brief_role: "Staff Software Engineer, Agentic Engineering (Posting #6596)" sitemap: false robots: noindex,nofollow body_class: ats-resume --- **Candidate:** Mike Hall (`Just3Ws`) Â· Principal Software Engineer **Target Role:** Staff Software Engineer, Agentic Engineering (Posting #6596) **Company:** Coder (Remote, US) **Core Domain:** Agent Harness, Tool Use Execution, Context Budget Management, Distributed Workflows --- ## ðŸŽ¯ Executive Summary & Mandate Alignment Coderâ€™s mandate: **evolving the agent harness, integrations, and long-running workflows that connect autonomous coding agents with real development environments**: aligns directly with my hands-on track record building production-grade Model Context Protocol (MCP) servers, bounded subagent architectures, and deterministic simulation engines. I design systems where agent capabilities are **verifiable, context-budgeted, compliance-safe, and decoupled from model churn**. --- ## ðŸ —ï¸ Direct Architectural Match & Evidence ### 1. Agent Harness, MCP Tooling & Execution Lifecycles * **System Built (`Agent Tooling`):** Architected and operate three production MCP servers (`ctx-mcp`, `o2-mcp`, `llama-mcp`) exposing live system state, telemetry, and local inference as callable tools to agent runtimes. * **Context Budgeting:** Designed context-isolated subagent topologies that keep high-volume auditing out of primary conversational context windows, enforcing strict token economics and registration checks. * **Provider-Agnostic Design:** Decoupled agent harnesses from single LLM vendors, allowing transparent fallbacks between local on-device models (`llama.cpp`) and frontier APIs. ### 2. High-Reliability Telemetry & Incident Escalation * **Production Provenance (`OneMain Financial`):** Founded and led the enterprise OpenTelemetry initiative across high-traffic Acquisition lanes. Refactored multi-service state machines to eliminate silent lateral state mutations, eliminating blind spots across service boundaries. * **Observability-Driven AI:** Built `o2-mcp` to pipe live OpenObserve telemetry (spans, traces, failed jobs) directly to agents with automated PHI-scrubbing at the OTel ingest edge, enabling safe root-cause diagnosis without data exposure. ### 3. Deterministic State Machines & Complex Workflows * **Production Provenance (`Phalanx Duel`):** Engineered a deterministic, server-authoritative simulation engine with zero-drift state replay across WebSockets, proving that AI workflows remain reliable only when state transitions are mathematically bounded. * **Modernization Under Load (`Coderwall`):** Migrated high-volume MongoDB workloads to PostgreSQL under continuous production load, establishing strict relational integrity contracts. --- ## ðŸ’¬ 30-Second Interview Calibration > "I specialize in the operational reality of agentic systems. Writing syntax is cheap; the hard engineering bottleneck is keeping autonomous agents safely harnessed to running environments through disciplined context budgets, deterministic tool contracts, and zero-leak telemetry. Coder is building the definitive operating platform for developer agents, and my background in MCP architecture and platform reliability is built specifically to scale that foundation." --- ## ðŸ”— Authoritative Verification Links * **Portfolio & Architecture Case Studies:** [just3ws.com/portfolio](https://www.just3ws.com/portfolio) * **Canonical RÃ©sumÃ©:** [just3ws.com/resume](https://www.just3ws.com/resume) * **GitHub Profile:** github.com/just3ws * **Archive & System Proofs:** [just3ws.com/interviews](https://www.just3ws.com/interviews)
