Coder (Staff Software Engineer, Agentic Engineering)

Staff Software Engineer, Agentic Engineering (Posting #6596)

****Candidate:**** Mike Hall (Just3Ws`) · Principal Software Engineer ****Target Role:**** Staff Software Engineer, Agentic Engineering (Posting #6596) ****Company:**** Coder (Remote, US) ****Core Domain:**** Agent Harness, Tool Use Execution, Context Budget Management, Distributed Workflows --- ## 🎯 Executive Summary & Mandate Alignment Coder's mandate: ****evolving the agent harness, integrations, and long-running workflows that connect autonomous coding agents with real development environments****: aligns directly with my hands-on track record building production-grade Model Context Protocol (MCP) servers, bounded subagent architectures, and deterministic simulation engines. I design systems where agent capabilities are ****verifiable, context-budgeted, compliance-safe, and decoupled from model churn****. --- ## 🏗️ Direct Architectural Match & Evidence ### 1. Agent Harness, MCP Tooling & Execution Lifecycles * ****System Built (Agent Tooling` ):** Architected and operate three production MCP servers ( `ctx-mcp` , `o2-mcp` , `llama-mcp`) exposing live system state, telemetry, and local inference as callable tools to agent runtimes. * ****Context Budgeting:**** Designed context-isolated subagent topologies that keep high-volume auditing out of primary conversational context windows, enforcing strict token economics and registration checks. * ****Provider-Agnostic Design:**** Decoupled agent harnesses from single LLM vendors, allowing transparent fallbacks between local on-device models (`llama.cpp`) and frontier APIs. ### 2. High-Reliability Telemetry & Incident Escalation * ****Production Provenance (OneMain Financial` ):** Founded and led the enterprise OpenTelemetry initiative across high-traffic Acquisition lanes. Refactored multi-service state machines to eliminate silent lateral state mutations, eliminating blind spots across service boundaries. \* **\*\*Observability-Driven AI:\*\*** Built `o2-mcp` to pipe live OpenObserve telemetry (spans, traces, failed jobs) directly to agents with automated PHI-scrubbing at the OTel ingest edge, enabling safe root-cause diagnosis without data exposure. ### 3. Deterministic State Machines & Complex Workflows \* **\*\*Production Provenance ( Phalanx Duel`):** Engineered a deterministic, server-authoritative simulation engine with zero-drift state replay across WebSockets, proving that AI workflows remain reliable only when state transitions are mathematically bounded. * ****Modernization Under Load**

(^Coderwall`):** Migrated high-volume MongoDB workloads to PostgreSQL under continuous production load, establishing strict relational integrity contracts. --- ## 🗨️ 30-Second Interview Calibration > "I specialize in the operational reality of agentic systems. Writing syntax is cheap; the hard engineering bottleneck is keeping autonomous agents safely harnessed to running environments through disciplined context budgets, deterministic tool contracts, and zero-leak telemetry. Coder is building the definitive operating platform for developer agents, and my background in MCP architecture and platform reliability is built specifically to scale that foundation." --- ## 🔗 Authoritative Verification Links * **Portfolio & Architecture Case Studies:** [just3ws.com/portfolio] (https://www.just3ws.com/portfolio) * **Canonical Résumé:** [just3ws.com/resume] (https://www.just3ws.com/resume) * **GitHub Profile:** github.com/just3ws * **Archive & System Proofs:** [just3ws.com/interviews](https://www.just3ws.com/interviews)
