Coder

Staff Software Engineer, Agentic Engineering (Posting #6596)

Candidate: Mike Hall ([Just3Ws](#)) · Principal Software Engineer

Target Role: Staff Software Engineer, Agentic Engineering (Posting #6596)

Company: Coder (Remote, US)

Core Domain: Agent Harness, Tool Use Execution, Context Budget Management, Distributed Workflows

Executive Summary & Mandate Alignment

Coder's mandate: **evolving the agent harness, integrations, and long-running workflows that connect autonomous coding agents with real development environments:** aligns directly with my hands-on track record building production-grade Model Context Protocol (MCP) servers, bounded subagent architectures, and deterministic simulation engines.

I design systems where agent capabilities are **verifiable, context-budgeted, compliance-safe, and decoupled from model churn.**

Direct Architectural Match & Evidence

1. Agent Harness, MCP Tooling & Execution Lifecycles

- **System Built ([Agent Tooling](#)):** Architected and operate three production MCP servers ([ctx-mcp](#) , [o2-mcp](#) , [llama-mcp](#)) exposing live system state, telemetry, and local inference as callable tools to agent runtimes.

- **Context Budgeting:** Designed context-isolated subagent topologies that keep high-volume auditing out of primary conversational context windows, enforcing strict token economics and registration checks.
- **Provider-Agnostic Design:** Decoupled agent harnesses from single LLM vendors, allowing transparent fallbacks between local on-device models (`llama.cpp`) and frontier APIs.

2. High-Reliability Telemetry & Incident Escalation

- **Production Provenance (`OneMain Financial`):** Founded and led the enterprise OpenTelemetry initiative across high-traffic Acquisition lanes. Refactored multi-service state machines to eliminate silent lateral state mutations, eliminating blind spots across service boundaries.
- **Observability-Driven AI:** Built `o2-mcp` to pipe live OpenObserve telemetry (spans, traces, failed jobs) directly to agents with automated PHI-scrubbing at the OTel ingest edge, enabling safe root-cause diagnosis without data exposure.

3. Deterministic State Machines & Complex Workflows

- **Production Provenance (`Phalanx Duel`):** Engineered a deterministic, server-authoritative simulation engine with zero-drift state replay across WebSockets, proving that AI workflows remain reliable only when state transitions are mathematically bounded.
- **Modernization Under Load (`Coderwall`):** Migrated high-volume MongoDB workloads to PostgreSQL under continuous production load, establishing strict relational integrity contracts.

30-Second Interview Calibration

"I specialize in the operational reality of agentic systems. Writing syntax is cheap; the hard engineering bottleneck is keeping autonomous agents safely harnessed to running environments through disciplined context budgets, deterministic tool contracts, and zero-leak telemetry. Coder is building the definitive operating platform for developer agents, and my background in MCP architecture and platform reliability is built specifically to scale that foundation."

Subject: Principal Engineer note: Rails, distributed scale & platform res

Copy Text

Hi [Name],

I saw Coder is scaling Staff Software Engineer, Agentic Engineering (Posting #6596) and looking for a Principal Software Engineer.

I specialize in high-consequence Ruby on Rails platforms and legacy modernization. Over the past several years, I served as Acquisition Lane Architect at OneMain Financial, decoupling lending funnels, eliminating a 4% silent transaction drop, and driving enterprise OpenTelemetry adoption across Rails and middleware tiers.

I put together a focused 1-page technical brief mapping my background to your current engineering challenges:

👉 <https://www.just3ws.com/exports/briefs/coder-staff-agentic-engineering/>

If this aligns with what you need on the team, I would be glad to compare notes. If timing is off, no need to reply.

Best,

Mike Hall
